

Cover image: Pictured are the flowering tree *Miconia affinis* and a bee. Antonio R. Castilla et al. studied pollen dispersal of *M. affinis* across more than 690 ha of tropical forest in central Panama. By examining pollination events and the genotypes of reproductive trees, the authors found that large-bodied bee pollinators were associated with increased seed production, whereas small-bodied bee pollinators helped facilitate long-distance gene flow among the trees and accounted for nearly half of long-distance pollen-dispersal events. The study highlights the role of functionally diverse pollinator communities in conserving plant genetic diversity. See the article by Castilla et al. on pages 12761–12766.
