

Cover image: Pictured are cardiac fibroblasts under simulated ischemic conditions. Svenja Hinrichs et al. report that treating heart cells with proadrenomedullin (ProADM), the putatively inactive protein precursor of the hormone adrenomedullin (ADM), increased cell survival during ischemia. ProADM exhibited proinflammatory effects in cardiac fibroblasts, unlike ADM, but antiinflammatory effects in activated immune cells. The results suggest that ProADM is biologically active and prevents cell death during heart attacks by regulating inflammation in conjunction with ADM. See the article by Hinrichs et al. on pages E8727–E8736. Image courtesy of Svenja Hinrichs.
