

Cover image: Pictured are islets of Langerhans, coated with biocompatible and permeable hydrogels. Alice A. Tomei et al. developed a method for encapsulating the islets with thin, complete, and uniform coatings of similar thickness on islets of different sizes. The authors found that encapsulation does not impair islet function and may allow for islet transplantation without immunosuppression. See the article by Tomei et al. on pages 10514–10519.
