

**Cover image:** Pictured are epithelial cells developing different, self-generating patterns depending on the concentration of collagen. Chin-Lin Guo et al. exposed human mammary gland cells to low (lower right), intermediate (middle), and high (upper left) concentrations of type I collagen in the extracellular matrix. The cells correspondingly developed no interactions, short-range interactions, and long-range interactions to condense cells and collagen. The findings reveal how cells can use mechanical forces to initiate and maintain long-range tubules. See the Feature Article by Guo et al. on pages 5576–5582. Image courtesy of Chin-Lin Guo.
