

Cover image: Pictured is the river Momo near Widikum village in northwestern Cameroon, an area where onchocerciasis, or river blindness, is endemic. Daniel Globisch et al. identified a biomarker in patient urine samples that could help monitor the progression of river blindness as well as its response to antibiotic treatment. The findings could enable researchers to develop a diagnostic tool for the disease, and the study's techniques could be used to find biomarkers for this and other neglected tropical diseases. See the article by Globisch et al. on pages 4218–4223. Image courtesy of Mark S. Hixon.
