

Cover image: Pictured is a male warbling vireo during its annual migration. T. Luke George et al. identified 23 bird species whose survival rates significantly declined following the introduction of West Nile virus to North America in 1999. For 12 of these species, including the warbling vireo, impacts to survival rates persisted every year after disease introduction. The findings illustrate the potential long-term effects of the introduction of infectious diseases for native species. See the article by George et al. on pages 14290–14294.
