

Cover image: Pictured are epithelial cells (green) and the zinc transporter protein ZIP10 (red) in skin from a two-day-old mouse. Bum-Ho Bin et al. found that ZIP10 is highly expressed in epidermal hair follicles and that ZIP10-mediated zinc influx is required for the activity of the epidermal development regulator p63. Further, deletion of the *Zip10* gene in mice resulted in epidermal hypoplasia, indicating the significance of ZIP10 and zinc homeostasis to epidermal development. See the article by Bin et al. on pages 12243–12248. Image courtesy of Koh-ei Toyoshima and Takashi Tsuji.
