

Cover image: Pictured is a montage of graphene cubes that can self-fold to form 3D structures. Marc Z. Miskin et al. bonded graphene sheets to nanometer-thick layers of glass to produce graphene-glass bimorph actuators that fold to enable the fabrication of 3D structures on the micron scale. The actuators can change shape in less than a second and support the incorporation of embedded electronics. According to the authors, the technology might have applications in the development of miniaturized machines. See the article by Marc Z. Miskin et al. on pages 466–470. Image courtesy of Marc Z. Miskin.

From the Cover

- 466 Self-folding graphene-based machines
- 400 Organic matter processing in microbial communities
- 555 Mosaic evolution in avian skulls
- 601 Brain lesions and criminal behavior
- 607 Perineuronal nets and fear memories
