

Cover image: Pictured is a social network of first-year engineering students in a competitive undergraduate university program. Christoph Stadtfeld et al. found that socially isolated students were more likely to receive low grades and drop out of school than students who had more friendships, positive exchanges with other students, and peers with whom to study. The findings suggest that friendships among students can lead to academic collaboration and success. See the article by Stadtfeld et al. on pages 792–797.
