

Cover image: Pictured is a mouse embryo stained with an anti-2H3 antibody for neurofilaments. Meng Xie et al. found that Schwann cell precursors can give rise to cartilage and bone cells in the craniofacial and trunk regions during embryonic development in mice and zebrafish. The finding suggests a previously unrecognized link between the nervous system and skeleton during development. See the article by Xie et al. on pages 15068–15073.
