

Cover image: Pictured is a species of *Eurycea* salamander that belongs to a radiation of aquatic, groundwater-dependent species endemic to the Edwards–Trinity aquifer system of west-central Texas. Thomas J. Devitt et al. found that groundwater development threatens the survival of *Eurycea* salamanders and other aquifer species endemic to the Edwards–Trinity system. The findings suggest that surface and subsurface hydrogeology were the primary drivers of *Eurycea* population divergence, and that *Eurycea* in west-central Texas are vulnerable to extinction because of habitat loss from declining water quality and groundwater depletion. See the article by Devitt et al. on pages 2624–2633. Image courtesy of Thomas J. Devitt.
